SCHLICK 100-200和 586 系列喷嘴 SCHLICK Series 100-200 and 586

处理量大、雾化稳定性好

SCHLICK 空心锥喷嘴将压力液体雾化成极细的液滴的同时，形成较大的雾化面

一般雾化角度是由喷嘴孔径的大小决定的

喷孔直径0.1至0.5 mm, 雾化角度大致为60°

喷孔直径0.5至1.6 mm, 雾化角度大致为70°

喷孔直径1.6至2.0 mm, 雾化角度大致为78°

喷孔直径2.1 mm以上, 雾化角度大致为80°-85°

对于表中比正常雾化角度大或小的情况，说明喷嘴配备了比表中所示更大或更小的直径的喷孔。

表中的流量数据对应于标称孔径,另外,喷嘴的长度有可能随孔径的变化而变化,通常我们会以压力差 Δp 为 3 bar 时的数据来说明或定义喷嘴

雾化形状:

空心圆锥体

雾化角度: 15°, 30°, 45°, 60°, 70°, 78°, 90°, 120°

如果喷孔直径为0.1-0.2mm

无法定制雾化角度,只有标准雾化角度喷嘴

处理量:

0.03 - 1400 升/分钟(3 bar时)

常用喷孔大小:

0.3 mm - 60 mm

如果喷孔直径为0.1-0.5mm,

可增加防堵过滤g

**For demanding applications:
High capacity and constant spray pattern**

SCHLICK hollow cones-nozzles atomise pressurised liquids into very fine droplets and thereby provide a large specific surface.

The **normal spray angle** is achieved by bore holes of

0.1 to 0.5 mm diameter approx. 60°

0.5 to 1.6 mm diameter approx. 70°

1.6 to 20 mm diameter approx. 78°

from 21 mm approx. 80° to 85°

For spray angles smaller or larger than the normal spray angle the nozzle is fitted with a smaller or larger exit hole than that shown in the table.

Each air flow rate corresponds to the nominal bore hole. In the same way, the total height of the nozzle can change. $\Delta p = 3$ bar is chosen for testing and nominal pressure.

Spray pattern:

circular hollow-cone

Spray angle: 15°, 30°, 45°, 60°, 70°, 78°, 90°, 120°

With bore holes of 0.1-0.2 mm ø:

Available only with the normal scatter cone

Capacity:

0.03 - 1400 l/min at 3 bar

Standard orifices:

0.3 mm - 60 mm

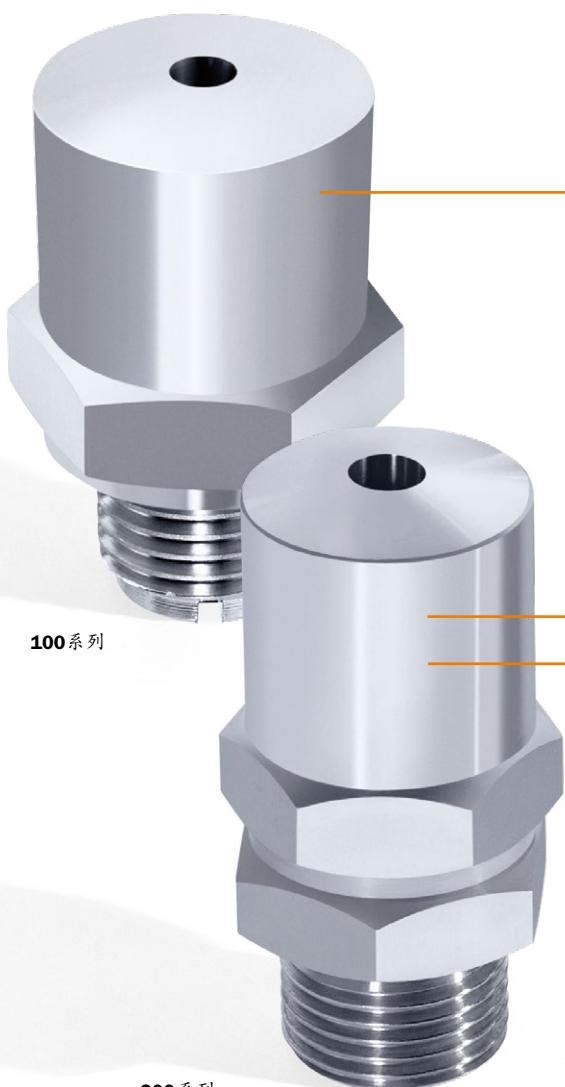

With bore holes of 0.1-0.5 mm: Optional fitting including a filter to prevent blockages

液体切向流入涡流室，从而开始旋转。
液体压力转化为旋转能或动能。
旋转的液体形成液膜，以空心锥体的形状喷出。

在喷嘴出口处，旋转的液膜与周围的空气发生碰撞，
分解成细小液滴，这些液滴沿轴向和径向远离喷嘴，
形成空心锥体。

The liquid flows tangentially into a swirl chamber and thereby starts to rotate. The energy in the pressurised liquid is converted into rotational energy or kinetic energy. A rotating film of liquid forms around an air core and emerges through the hole as a hollow cone.

At the exit of the nozzle the liquid film encounters the surrounding air in a reciprocal reaction and breaks-up into fine droplets. These move away from the nozzle in an axial and radial direction and form a hollow cone.

200系列喷嘴与100系列喷嘴性能参数完全相同，
只是200系列喷嘴增加了一个六角螺栓，
以便于拆卸和清洁。

The SCHLICK model 200 has the same characteristics as model 100. The model 200 is fitted with a hexagon bolt on the screw fitting in order to facilitate removal and allow it to be cleaned more easily.

SCHLICK 100-200和 586 系列 SCHLICK Series 100-200 and 586

即使在液体压力波动的情况下，也能实现空心锥雾化

处理量大小和雾化液滴大小由喷嘴孔径、雾化角度、液体压力、密度、粘度和表面张力所决定。

最小雾化压力

孔径0.1 – 0.5 mm：压力差至少 $\Delta p = 3 - 6$ bar

孔径0.5 – 1.6 mm：压力差至少 $\Delta p = 0.5$ bar

孔径1.6 mm 以上：压力差至少 $\Delta p = 0.1 - 0.5$ bar

相同孔径下的液滴大小：

压力大=液滴小

压力小=液滴大

相同压力下的液滴大小：

孔径大=液滴大

孔径小=液滴小

$$d_T \sim \emptyset$$

相同孔径和相同压力下的液滴大小

雾化角度大=液滴小

雾化角度小=液滴大

$$d_T \sim \frac{1}{\text{雾化角度}}$$

高粘度和表面张力大的液体不一定能实现空心锥雾化，需用喷嘴进行实测试验，即使可以，雾化液滴一般比较大。

Even hollow cone even with fluctuating liquid pressure

The quality of the atomised spray and the droplet spectrum are related to the diameter of the hole, the pressure, the scatter cone, the density, the viscosity, and the surface tension.

Minimum atomising pressure

0.1 – 0.5 mm Ø: $\Delta p = 3 - 6$ bar

0.5 – 1.6 mm Ø: $\Delta p = 0.5$ bar

ab 1.6 mm Ø: $\Delta p = 0.1 - 0.5$ bar

Droplet size with the same bore hole size:

higher pressure = smaller droplets

lower pressure = larger droplets

Droplet size with the same pressure:

larger bore hole = larger droplets

smaller bore hole = smaller droplets

$$d_T \sim \emptyset$$

Droplet size with the same bore hole size and the same pressure:

larger spray angle = smaller droplets

smaller spray angle = larger droplets

$$d_T \sim \frac{1}{\text{spray angle}}$$

Liquids with higher viscosities and surface areas must be tested for their atomisation with hollow cone nozzles. Compared to water, the fineness of the atomisation is generally coarser.

流量数据是以16°C的水测得的, 不同密度的流体流量系数参照左侧图表, 喷芯的孔径是以0.1递增, 上表的数据都是标称孔径下的数据。如果要求的雾化角度是非标的, 要满足上图的流量, 喷芯孔径可能要变大或者变小。

The air flow performance is based on water at 16°C – liquids of different thickness can be calculated using the conversion table on the left. The bore hole diameter is marked on the nozzle in 1/10 mm. For technical reasons, nozzles, which produce a spray cone differing from the normal spray cone, must be fitted with smaller or larger bore holes. Each air flow rate corresponds to the nominal bore hole.

相位多普勒测量 技术

PDA measurement technology

SCHLICK测量系统采用双相位激光多普勒测试原理(5瓦氩离子激光器),能精准测量雾化液滴参数和其流体特性

The SCHLICK measurement system, a drop measurement device designed according to the dual PDA principle (PDA = Phase-Doppler Anemometry), uses a 5-watt (argon-ionic) continuous wave laser.
